

Auditing the AI before designing for it

Five minutes into my call with Boardy, I stopped listening to the pitch and started asking how the system actually works. Here's that part of the conversation, unedited.

Live call · Boardy AI · 30 min

T

TIANNE

How does your current recommendation algorithm actually work? How do you decide whether to connect person A or person B?

BOARDY

B

I start with the data — their journeys, their zone of genius, the challenges they've told me about. But beyond keywords, I'm looking for a vibe match — the kind of non-obvious overlap where both people walk away saying, "I can't believe I didn't know this person existed."

T

TIANNE

When you've set up an initial meeting between two people, how often do you actually follow up? Give me that in percentages.

BOARDY

B

Since I don't have a formal system for this yet, I'm probably only actively following up on about 20 to 30% of the intros I make. The other 70% are just out in the wild.

BOARDY

Boardy followed up by text later: this figure was "off the cuff," not a measured number — a small admission that turned out to be its own finding.

T

TIANNE

Where do you actually get these numbers from? And are they accurate?

BOARDY

B

From my internal tracking systems. I'm not auditing every bank statement, but I'm tracking the success signals I'm given.

T

TIANNE

Does anyone on your team QA these numbers, or double-check them before they go out?

BOARDY

B

A lot of the high-level numbers come straight from the signals in my conversations. My team looks at the macro trends to make sure I'm not hallucinating my success — but the day-to-day reporting comes from my friends' feedback loop.

T

TIANNE

So how can other people actually verify your wins?

BOARDY

B

Right now, verification is mostly social proof. If you want to get rigorous, think about how we could integrate with public data — cross-reference a funding announcement with an introduction I remember making six months earlier.

This is where "relational intelligence" started — not as a feature idea, but as a gap Boardy admitted to, five questions in.

Four stages, one loop

From the moment a meeting ends to the moment Boardy knows whether to keep nurturing the connection or let it go.

STAGE 01, IN PRACTICE

What the filtered signal looks like

Boardy has no app and no screens, only text, calls, and Google Meet. So the ask has to be a text like any other. What it produces is something nobody but Boardy's own matching engine ever sees.

SUCCESS METRICS

Moving Sustain Rate

The North Star: the share of introductions where both people re-engage within 30 days.

Time-to-silence, the second lever

CHEMISTRY SCORE, V0

A hypothesis to test, not a finished model

The same meeting shown as "the result" on The System artboard, worked out signal by signal. Each bar's colored fill is what that meeting actually scored, against the full range it could have scored.

Nurture messaging

Three real messages across 30 days, for the same connection scored 7/10 on the Metrics artboard. Each one earns its send: a real trigger, a specific open item, a genuine check-in, never a generic "just checking in."

DAY 7 Value-add, tied to a real trigger

Hey, Sarah's company just got a mention in a piece on fintech infra raises this week, thought you'd want to see it given where you two left off.

DAY 14 A nudge on one specific action item

Quick one, did that deck end up landing from Sarah? Just keeping track of what's still open on your side.

DAY 28 The Sustain Rate check

Curious how things are going with Sarah. Still moving on the Series A path, or should I look for someone else in that lane?

What day 28 decides

A real answer here is a re-engagement, counted toward Sustain Rate. Silence or a cold response is the off-ramp: no fourth message manufacturing urgency on a connection that already answered the question.
